

AtProteinChip_2

The chips have 48 blocks. Within each block, there are 21 (rows) x 20 (columns) of spots. Every protein is printed in two duplicated spots.

Above shows the Western result for one of the blocks, which indicates protein intensities in each spot. All proteins were tagged with a 9 x cMyc tag, and Western was carried out using an anti-cMyc antibody.

The following page represents a Western blot of the whole protein chip with anti-cMyc antibody.
